

Product Requirements Document

PrepFlow — Hybrid AI Exam Practice & Progress Tracker

1. Product overview

Product name: PrepFlow

Product concept: A hybrid AI-powered exam-practice, revision, and progress-tracking app. It preserves the original order of uploaded question banks and creates a persistent AI-generated sequence from theory books.

2. Problem statement

Exam aspirants often rely on question banks, theory books, PDFs, notes, and manual records. They lose their stopping point, do not measure accuracy consistently, forget wrong questions, and must switch between multiple tools. Generic trackers require manual reporting and cannot reliably connect source material, answers, daily targets, and revision.

3. Target users

- Primary user: exam aspirants aged roughly 16–35 preparing for competitive, entrance, board, or certification exams.
- They use mobile devices frequently, own or have permission to use study PDFs/books, and want clear daily and long-term progress.
- Secondary user: platform administrator who operates the system but does not automatically access private study content.

4. Product vision

PrepFlow lets an aspirant upload their own study material, practice inside one application, and automatically convert each answer into progress, accuracy, revision, and daily-study insights.

5. Product principles

- One workflow: no copy-paste between a chatbot, PDF, spreadsheet, and tracker.
- Trustworthiness: a stored book answer key determines scoring whenever one exists.
- Persistence: extracted and generated questions are stored before they are shown.
- Source grounding: AI questions and explanations must be based on the user's uploaded material.
- Privacy by default: books and performance data are private to the user.

6. Core product modes

Mode	Material	Behavior
Sequential question bank	Numbered MCQs with answer key	Extract/store exactly; serve in original Q1 → Q2 → Q3 order; score with saved answer key.
Theory AI practice	Theory chapters, notes, paragraphs	Retrieve source passages; generate one MCQ; save it permanently with an internal sequence.
Mixed-book practice	Theory plus chapter-end MCQs	Serve extracted MCQs where present; generate supplementary theory practice.
Revision practice	Incorrect/skipped/unsure items	Resurface scheduled questions without corrupting primary sequence progress.
Topic practice	Chosen subject/chapter	Serve unused relevant questions or generate source-grounded practice.

7. Core features

Feature	Description	Priority
Authentication	Secure signup, login, logout, verification, reset password	Must-have
Onboarding	Exam name, date, timezone, daily question target	Must-have
Private book upload	User uploads PDF, DOCX, or TXT	Must-have
Document classification	Identify question bank, theory, or mixed material	Must-have
Question extraction	Preserve MCQ order, options, key, explanation, source page	Must-have
Practice engine	One MCQ at a time, A/B/C/D, secure scoring, next question	Must-have
Theory AI generation	Retrieve from own book and save generated questions	Must-have
Dashboard	Today, yesterday, target, accuracy, progress, next action	Must-have
Revision queue	Schedule incorrect/unsure questions for review	Must-have
Analytics	Subject/chapter accuracy and weekly trends	Must-have
Streaks, timer, mistake labels	Consistency and diagnostic tools	Should-have
Hints, Hindi explanations, adaptive plan	Learning enhancements	Nice-to-have

8. Primary user flow

First use: Sign up → set exam and daily target → upload resource → app processes/classifies it → user confirms result → selects active book → starts practice.

Question bank: Dashboard → Continue Practice → next unanswered saved question → select option → Submit → server scores → explanation/source shown → revision scheduled if required → Next Question.

Theory book: Dashboard → Continue AI Practice → app retrieves permitted source text → generates and validates one MCQ only if next saved item does not exist → saves question → user answers → server scores against saved key → next sequence continues.

9. MVP scope

- Email/password authentication and user-owned private data.
- One active exam profile, upload of PDF/DOCX/TXT, classification, and book status.
- Clean text-based question-bank extraction and exact original-order practice.
- Theory retrieval and create-once AI question generation.
- Secure answer scoring, explanations, daily target, yesterday summary, basic analytics, and revision queue.
- Responsive mobile-first web app and book deletion controls.

10. Out of scope for version one

- Live coaching, groups, leaderboards, chats, payments, native app-store apps, complex ranking, full mock-test simulator, automatic perfect OCR for every scanned document, browser scraping, and direct access to a personal ChatGPT Project.

11. Success metrics

Area	Measures
Activation	Upload completion rate, processing-ready rate, time to first answer, users completing first five questions
Engagement	Questions per active user/day, sessions/week, daily-goal completion, 7/30-day retention
Learning	Unique questions completed, chapter accuracy, revision completion, accuracy improvement after revision
Reliability	Processing success, extraction validation pass rate, AI generation failures, duplicate-question rate, loading time

12. Key assumptions

- Users have rights/permission to upload the material.
- Initial formats are PDF, DOCX, and TXT; clean digital PDFs work best.
- Internet is required for upload, retrieval, and AI generation.
- English is the initial primary language; Hindi explanation can be added later.
- AI-generated content can be flagged by users if quality is questionable.
